- products and services customised to customer needs and preferences
- customer support based on trust and co-operation

# TABLE PILOT

Competence  
is running your floor

## Table Pilot casino management system

The basic unit of the **Table Pilot** casino management system is the **Base Table Control System**, which was the first product designed to support the management of standalone table games like American Roulette, French Roulette, Black Jack, Poker, Punto Banco and others. It helps casino operators to control their business, casino managers to make the right decision, and casino employees to be more efficient.

The **Base Table Control System** products form the hardware base for the **Table Pilot Management System**, which is an efficient on-line casino floor management system. Table Pilot can easily be upgraded with player tracking connected to the existing resource planning systems, as used by most casinos.

## Why choose the Table Pilot casino management system?

- **competence and experience in casino management**
- **excellence in advanced technologies**
- **products and services customised to meet customer needs and preferences**
- **customer support based on trust and co-operation**
- **because the Table Pilot casino management system provides you with:**
  - automated control of live games processes
  - transparency of gaming operations: it gives an immediate insight into each table's performance and gross gaming revenues
  - multiple display functions: animation, game results or marketing messages, all ready to attract customer interest
  - quick and accurate calculation of payouts: this saves time and minimises mistakes
  - data is entered at the table: this enables simple analyses and provides the management with information needed for making the right and timely decisions
  - an on-line casino system with efficient reports and online messaging tools
  - simple upgrading with player tracking and other tools
- **because our customers are satisfied with it**
- **because we are after excellence in operability, technology, design and customer support**

## Excellence in operability

Some of the main advantages of the Table Pilot control system are its user-friendliness, an easy-to-use and plug-and-play design, and excellent security. What is more, it is interconnective, upgradeable, and it can be translated into your language. The system enables and/or facilitates the following:

- table opening and closing
- hourly table results inventory
- player counting
- prompt entering of drop and tip
- fill/credit
- payout calculator
- real-time win/loss calculation for each table
- table data history review
- adjustable security warnings: wheel too slow/quick, drop/tip/number of players too high, etc.
- display of real-time game results
- display of table name and minimum
- audio and video signal upon calling a valet or inspector
- reporting and messaging modules

## Excellence in technology

Our products are based on open standards and have simple architecture. They can fulfil every customer need. They represent excellence in combining advanced solutions and up-to-date technologies into groundbreaking results.

### The main features of our products are:

- plug-and-play and open infrastructure
- upgradeable powerful personal computer with standardised inputs and outputs
- MS Windows and Linux based applications
- intelligent setup and diagnostic features
- easy-to-change standardised parts
- a robust, efficient and reliable design

## Excellence in design

**Single or double-side LED or LCD graphic display** – with an attractive design to satisfy the casino operators' need for glamour. It supports any type of animation, as well as roulette and card games results, marketing messages, and much more.

**Ball Reader** – a brilliantly designed apparatus for an intelligent roulette ball tracking. It fits the shiny gaming floor environment perfectly.

**White Box** – a computer box hiding certain parts for security reasons. It is discretely installed under the table so that no wiring and cables are visible.

**Touch Screen** – integrated touch screen with a thin design and robust construction.

## Excellence in customer support

Our aim is to establish a long-term relationship based on customer satisfaction. We intend to build up confidence and trust by customising our products to customers' needs and preferences, and by setting up a wide range of customer support services. We believe that customers are retained as a result of superior performance across the entire customer lifecycle, not as a result of superior sales processes.

## Table Pilot casino management system as a casino intelligence support

ICIT is currently developing a new and comprehensive system intended to provide support to gaming floor managers – the Smart Table Management System. This system combines **game and casino resource management**, including player, money and chip **tracking functionalities**, into a complex **casino intelligence** system.

### The approach of Table Pilot is innovative in many aspects:

- as a **software** solution, as it is based on novel and advanced approaches in information and communication technologies;
- as a **hardware** solution, as it is constructed from standard and widely used high-quality components;
- in **design**, as it combines a wide range of products in one visual entity.
